NOW — MASTER STRATEGY & INVESTOR DOCUMENT

A single investor-ready reference document bringing together the product vision, universal intent architecture, monetisation system, Local Impact thesis, technical operating model, go-to-market logic and phased scale roadmap.

NOW

Live Local. Live Now.

Illustrative product direction: NOW as a real-time local discovery and action interface.

Core positioning

NOW does not monetise restaurants. NOW monetises real-time intent in the physical world. It creates value when intent becomes discovery, visibility, a lead, a booking, a transaction or a recurring local business relationship.

What this master memo does

This document consolidates the original 27 monetisation options, the strategic reframing beyond restaurants, the local impact / better living layer, the investor narrative, illustrative economics, the merchant product, the API story, and the exact strategic additions required for a stronger fundraising presentation.

Table of contents

1. Executive synthesis

2. Why NOW matters: problem, vision and product thesis

3. The strategic correction: from restaurant use case to universal intent platform

4. The six monetisation engines

5. Universal transaction engine

6. CPA / affiliate launch layer

7. Sponsored intent

8. NOW for Business

9. NOW Engine / API

10. Monetisation by category

11. Local impact, better living and territorial value

12. Technical and operating architecture required

13. Phased monetisation roadmap

14. Illustrative economics and KPI framework

15. Investor narrative and team alignment

16. Product experience: from intent to action

17. Local impact measurement framework

18. Go-to-market and city launch logic

19. Team, operating footprint and funding roadmap

20. Strategic guardrails and investor questions

21. Exact additions to the original 27-model file

22. Vision lock: the Operating System for Local Life

23. Live Territory and the complete customer journey

24. Network effects, defensibility and the NOW flywheel

25. Future verticals and strategic coherence

Appendix A. Full 27-model catalogue

Appendix B. Visual direction

1. Executive synthesis

The strongest single message for the team and for investors.

- The original 27-model monetisation work is valuable because it shows depth and optionality. It should be kept and respected.
- However, the current framing is too restaurant-centric. The business can appear narrower than the actual product vision.
- NOW should be presented as a universal real-time intent platform for the physical world: restaurants, events, activities, wellness, mobility, hospitality, retail, culture, local services and, over time, producers and local commerce.
- The company's monetisation architecture should therefore be grouped under six engines: Transactions, Business Software, Performance, Sponsored Intent, Platform/API, and Data/Financial.
- The local impact layer is strategically important. NOW can help people discover nearby healthy food, local producers, activities, experiences and services they often do not know exist, while helping local businesses capture real demand.
- This master document therefore keeps the depth of the 27 options, but changes the hierarchy, sharpens the investor story and makes the scale of the opportunity easier to understand.

Current perception risk	Recommended framing
A restaurant occupancy / yield tool	A universal local-intent platform for the physical world
27 separate ways to make money	Six monetisation engines with a clear activation sequence
Generic advertising opportunity	Sponsored intent inside immediate, high-value user requests
Merchant subscriptions without a defined product	NOW for Business: real-time availability, conversion tools, AI activation and analytics
Late monetisation only after merchant density	Early monetisation through affiliate / CPA, local partners and booking commissions
Abstract impact story	Concrete local impact: local commerce, better discovery, healthier choices, activity and territorial value

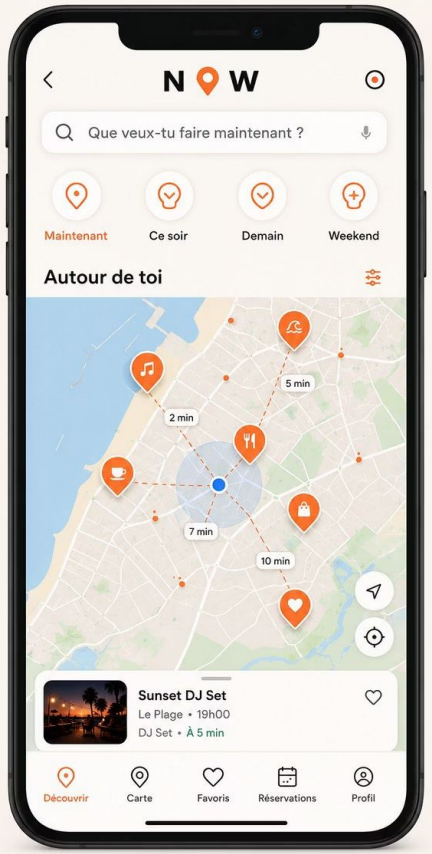

Bottom line

Keep the depth. Change the hierarchy. Add the local impact layer. Make the investor understand that NOW is a demand engine for the real world, not just a tool for one vertical.

2. Why NOW matters: problem, vision and product thesis

Today, discovering what to do around us still requires jumping across disconnected tools: maps, social platforms, review sites, booking apps, ticketing platforms, transport apps and local directories. Information is fragmented, often outdated, rarely contextual and almost never truly aligned with the user's immediate moment.

- The user question is simple: "What can I do around me, right now?"
- The difficulty is not lack of content. The difficulty is real-time relevance, availability and actionability.
- NOW's core product thesis is that a user should be able to express intent once, and receive a real-time, contextual answer that can be acted on immediately.
- The strongest strategic asset is the moment of intent itself: high-intent, local, contextual, time-sensitive demand.

Illustrative interface: NOW turns intent into nearby options, map context and an immediate next step.

The economic event

Monetisation begins when a real-time intent session becomes a measurable commercial or behavioural event: an impression, a qualified lead, a booking, a transaction, a merchant relationship, a subscription or API usage.

3. The strategic correction: from restaurant use case to universal intent platform

Restaurants can be an early proof point because availability, occupancy and local demand are relatively easy to understand. But they must never become the definition of the company.

- A strong investor story needs a category-neutral architecture.
- NOW should work across restaurants, events, activities, wellness, beauty, culture, mobility, hospitality, shopping, local services and producer/local food discovery.
- The same intent engine should monetise differently by category and market without changing the product thesis.
- This is what gives NOW the chance to scale globally while remaining locally useful.

	NOW asset	Commercial event	Who pays	Why this scales
High-intent local demand	Intent becomes discovery, a lead, a booking or a transaction	Merchant, partner platform, consumer, brand, institution or payment flow	Same engine can monetise differently across categories and geographies	

Team sentence to anchor everything

NOW does not monetise restaurants. NOW monetises real-time intent in the physical world.

4. The six monetisation engines

Engine	How NOW earns	Where it fits best
1. Transactions	Commission, take rate, flat booking fee, deposits, payment margin, protection	When NOW directly generates or processes a booking or purchase
2. Business Software	Subscriptions, freemium, tiered plans, multi-site licence, campaign credits	When NOW becomes an operational tool that a merchant uses every week
3. Performance	CPA, qualified lead fee, cost per new customer, incremental demand share	When merchant value can be clearly measured and fixed risk needs to stay low
4. Sponsored Intent	Clearly labelled sponsored placement, paid real-time offers, brand-funded activations	When the user has immediate commercial intent and relevance can be preserved
5. Platform / API	API usage, enterprise licences, white-label deployment, partner revenue share	When third parties want NOW intelligence without using only the consumer app
6. Data / Financial Layer	Benchmarks, payments, revenue advances, selected market intelligence products	Only once sufficient volume, trust, compliance and operational maturity exist

Important discipline rule

Lead with these six engines in the investor story. Keep the 27-model catalogue as an appendix and strategic toolbox, not as the opening message.

5. Universal transaction engine

One of the most important additions is to describe NOW as a multi-category transaction infrastructure. The current take-rate logic is valid, but it must be rewritten beyond restaurants.

- If NOW creates a transaction, NOW can participate in the transaction economics.
- This can apply to restaurant bookings, event tickets, surf lessons, museum entries, spa appointments, local taxis, guided tours, classes, family activities, wellness bookings, local services, retail pickup or other bookable actions.
- The value of this framing is that it immediately expands the revenue logic from one vertical to a platform-level mechanism.

Category	Example transaction	Potential revenue shape
Restaurant / food	Table booking, set menu reservation, no-show protection	Per booking fee, percentage take rate, deposit fee
Activities / sport	Surf lesson, yoga class, guided tour, family activity	Commission, CPA, bundle margin
Mobility / local services	Taxi, local transfer, nearby urgent service	Affiliate / partner fee, lead fee, commission
Events / culture	Ticket purchase, seat reservation, festival pass	Commission, flat fee, partner revenue share
Wellness / beauty	Spa slot, massage, treatment, salon booking	Booking fee, take rate, deposits
Retail / producers	Click & collect, local product basket, market pickup	Transaction margin, partner fee, merchant subscription uplift

6. CPA / affiliate launch layer

NOW should not wait to own all supply before it can monetise. A major strategic advantage is the ability to capture value at the discovery and handoff layer, especially early on.

- When NOW answers a user request and sends that user to Booking, GetYourGuide, Uber, Ticketmaster, OpenTable or another booking/transaction platform, NOW can potentially earn an affiliate commission, CPA or revenue share.
- This matters because it reduces the classic chicken-and-egg problem of marketplaces.
- It allows NOW to monetise before signing every merchant directly, while building demand, data and trust.
- It also gives the team a realistic path to the first revenue dollar.

Early-stage logic

Phase 1 monetisation can come from partner inventory, affiliate links, CPA relationships, booking commissions and a small number of pilot merchants. This keeps the go-to-market realistic and capital efficient.

7. Sponsored intent

The opportunity is not generic display advertising. The valuable product is relevant paid visibility inside an immediate, high-intent request.

User request	What NOW knows	Sponsored opportunity
“Where can I eat in 20 minutes?”	Location, time window, food intent, available options	A nearby relevant restaurant can pay for clearly labelled placement if capacity exists
“What can I do with my children this afternoon?”	Family context, nearby activities, time availability	Relevant attractions or activities can be eligible for sponsored visibility
“Where can I find healthy local food now?”	Health/local intent, timing, geography, nearby supply	Healthy restaurant, market or producer can surface if truly relevant
“What should I do tonight?”	Evening context, event potential, crowd/time profile	Events or venues can promote relevant offers in context

- Sponsored results must always be transparent and clearly labelled.
- Payment must never override relevance, availability, user trust or safety.
- Pricing can take several shapes: cost per qualified impression, cost per click / lead, cost per booking, campaign budgets or, later, auction mechanisms.

8. NOW for Business

The existing monetisation work includes subscriptions, freemium and multi-site logic. What it needs is a clearer definition of what the merchant is actually buying. That product should be framed as NOW for Business.

Capability	Merchant value
Real-time availability	Publish what is genuinely available now, tonight or tomorrow
AI offer creation	Turn unused capacity, cancellations or low-demand windows into relevant offers
Demand alerts	Tell businesses when nearby user demand matches their category, service or capacity
Conversion attribution	Show what users searched, what NOW surfaced and what converted
Booking / transaction tools	Direct reservations, deposits, payment links or checkout where relevant
Automated content distribution	Update profile, availability and offers from one source
Performance dashboard	Track leads, bookings, incremental demand, repeat users and ROI
Multi-site controls	Serve groups, hotel operators, chains, campuses or franchises
Integrations	POS, PMS, calendars, ticketing, inventory and payment providers
AI business agent	Recommend when to activate offers, adjust availability or target nearby demand

Illustrative packaging

Free / Presence | Pro / Growth | Performance | Enterprise / Multi-site. The principle is simple: free coverage for supply density, then recurring value for automation, intelligence and measurable demand.

9. NOW Engine / API

“Licensing the engine” should be expanded into a strategic pillar. The core NOW intelligence can have significant value outside the consumer application itself.

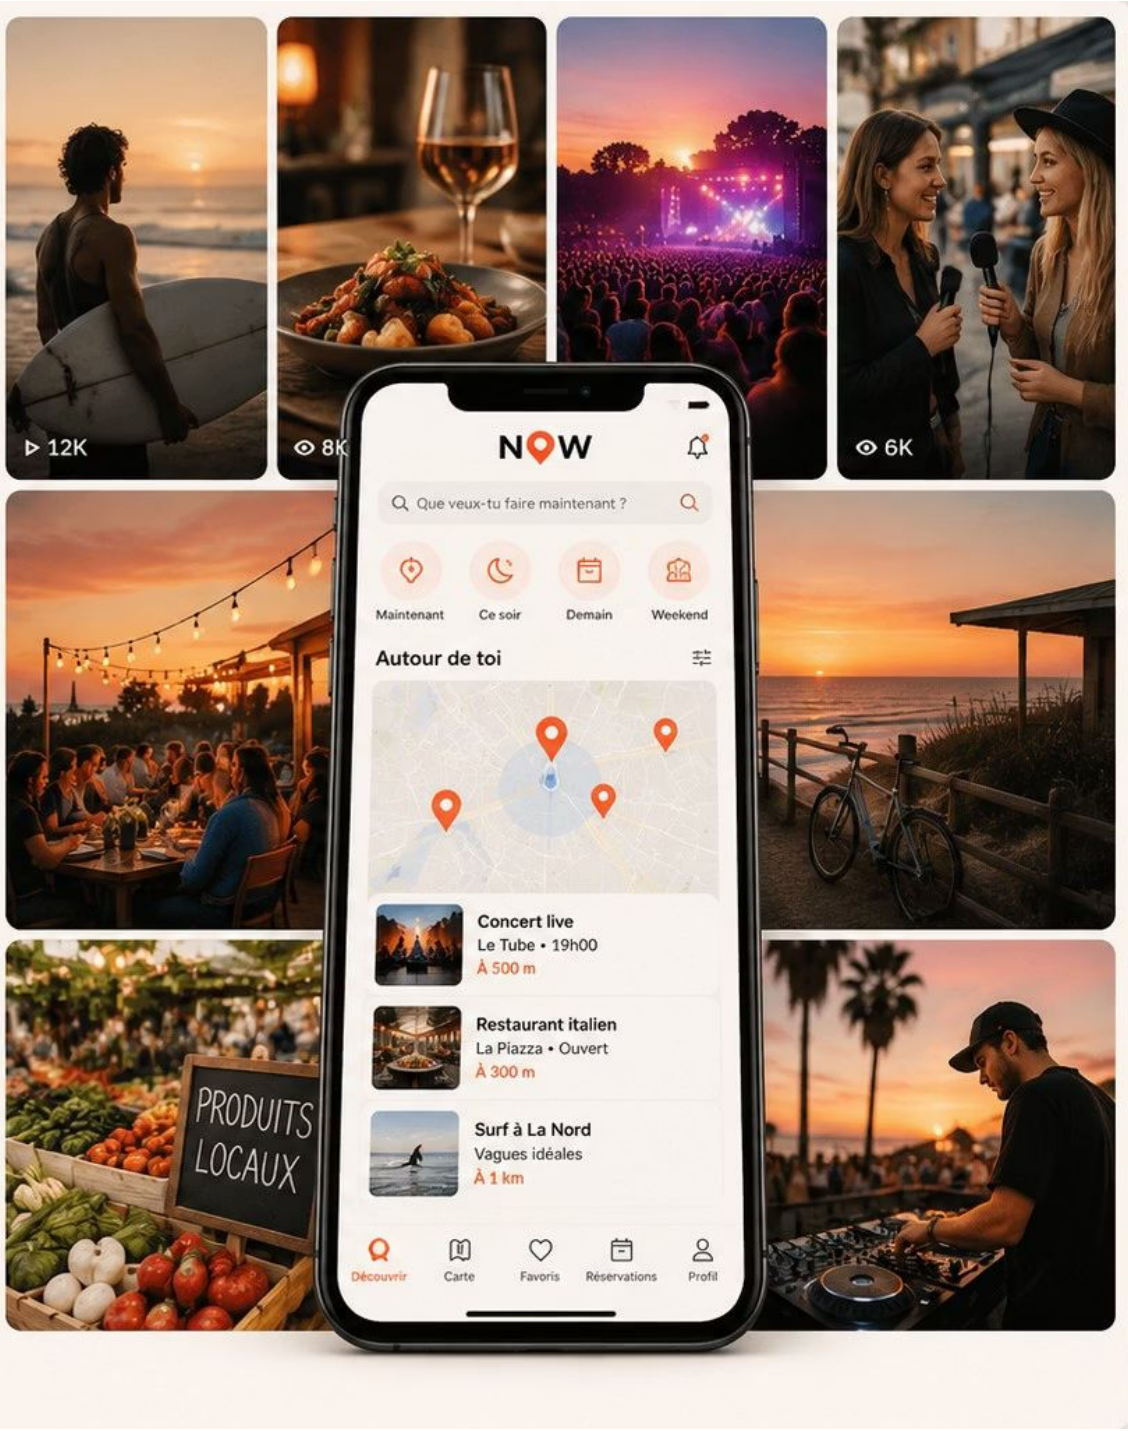

Partner type	Illustrative question NOW can answer	Commercial opportunity
Hotels / concierge	What can this guest do within 2 km in the next two hours?	Enterprise contract, white-label, revenue share
Airlines / airports	What can passengers do during a layover or after arrival?	API usage, enterprise pricing
Travel platforms	What can travellers do around this accommodation right now?	Embedded discovery layer, affiliate / transaction share
Connected cars / mobility	Which nearby destinations, stops or services are relevant now?	API licensing, partner usage fees
AI assistants	What can I actually do nearby right now?	Availability layer for third-party assistants
Third-party apps	Can we embed NOW recommendations and action flows?	Developer platform and partner monetisation
Cities / tourism boards	How can we activate underused areas and surface local offers?	Institutional contracts, dashboards, local economic programmes

10. Monetisation by category

Category	Primary user value	Best early revenue lines
Restaurants / food	Where can I eat now? What is open? What healthy/local options are nearby?	Booking fee, CPA, subscription, sponsored intent
Events / nightlife	What is happening tonight?	Ticket commission, sponsored intent, affiliate
Activities / sport	What can I do this afternoon?	Commission, CPA, partner inventory, merchant subscription
Wellness / beauty	Where can I book now?	Booking fee, take rate, subscription, sponsored intent
Mobility / local services	How do I get there? What service is available nearby now?	Affiliate, lead fee, partner revenue share
Hospitality / travel	What should I do around where I'm staying?	Affiliate, API, white-label, experience commissions
Retail / producers / markets	Where can I find local products, healthy food or pickup today?	Merchant tools, transaction share, institutional or local partnership revenue

11. Local impact, better living and territorial value

Illustrative visual direction: NOW connecting local food, activities, culture, producers, surf, events and community life.

The local impact layer is not cosmetic. It is a meaningful strategic extension of NOW's core idea. Many people do not actually know what is available around them: good restaurants, healthier food, local producers, family activities, wellness options, outdoor experiences, local events and useful nearby services. NOW can make the local environment visible again.

Support localism: bring demand to local businesses, independent operators, producers, artisans and cultural actors.

Support better everyday choices: make healthy food, natural products, local produce and outdoor or wellness activities easier to discover.

Support local economic circulation: help demand stay within neighbourhoods, towns and territories instead of leaking immediately to distant platforms.

Support a stronger civic narrative: cities, tourism boards, business associations and local institutions can see NOW as a useful activation tool, not just a commerce app.

Support sustainability without overclaiming: shorter-distance discovery, local commerce activation, reduced wasted capacity and stronger visibility for local supply can all form part of the value proposition.

Local-impact use case	What NOW can do	Potential value
Healthy local food	Surface healthy restaurants, natural food, farm-to-table spots, local products and nearby producers	Better user choice + demand for local food businesses
Producers / markets	Show markets, maraichers, farm shops, pickup windows and seasonal availability	Helps small suppliers access local demand
Outdoor / family activities	Recommend parks, surf, sport, cultural or family experiences nearby	Healthier activity and community discovery
Territorial activation	Surface underused neighbourhoods, seasonal events or local cultural offers	Useful for tourism boards, cities and event partners
Unused capacity	Transform idle inventory into relevant real-time discovery and offers	Economic value + lower waste of perishable time/capacity

Careful wording for investors

NOW can help people discover healthier, more local and more relevant options at the exact moment of intent. It can also help local businesses, producers and territories activate demand more efficiently. This should be presented as a strategic capability and measurable objective, not as an unproven universal outcome.

12. Technical and operating architecture required

To make the monetisation story credible, the team should also show the enabling operating architecture. Investors do not need deep engineering detail in the main pitch, but they need to see that the monetisation plan is grounded in real product capabilities.

Layer	What it must do	Why it matters
Intent engine	Interpret user intent, time horizon, category, location and context	Foundation of relevance and cross-category expansion
Supply / availability layer	Ingest structured listings, availability, booking windows, schedules and inventory	Enables real-time answers rather than static directories
Recommendation & ranking layer	Match intent to relevant, available and trustworthy options	Critical to trust and repeat usage
Action / transaction layer	Support handoff, booking, payment, deposits and transaction capture	Enables direct monetisation
Merchant operating layer	Provide dashboards, publishing tools, analytics, automation and controls	Makes subscriptions and retention credible
Attribution & analytics layer	Track intent-to-action, conversion, merchant value and ROI	Enables performance revenue and investor proof metrics
Sponsored intent guardrails	Label paid placements and protect relevance / safety	Preserves trust while monetising intent
API / partner layer	Deliver NOW intelligence to third parties via API or white-label flows	Creates B2B scale opportunity
Compliance & governance	Handle privacy, payment rules, consumer trust and data use	Necessary for scaling payments, data and financial services

13. Phased monetisation roadmap

Phase	Objective	Main revenue lines	What to prove
0 — MVP	Prove NOW can understand intent and produce useful real-time answers	None or light monetisation; pilot partners; soft affiliate tests	User value, supply match rate, repeat usage
1 — First dollar	Show NOW creates measurable demand	CPA, affiliate, lead fees, booking commissions, initial local partners	Intent-to-action, conversion attribution, merchant interest
2 — Recurring revenue	Turn NOW into a business tool	NOW for Business subscriptions, performance fees, sponsored intent	Merchant retention, paid adoption, ROI visibility
3 — Own more of the transaction	Increase monetisation per successful intent	Payments, deposits, checkout, protection, merchant services	Payment conversion, trust, operational quality
4 — Infrastructure	Monetise NOW as a platform	API, enterprise licensing, white-label, destination / institution contracts	Partner demand, integration value, enterprise readiness
5 — Scale headroom	Add selected data and financial products	Benchmarks, payment economics, revenue advances, selected financial services	Compliance, volume, risk quality, trust

Investor takeaway

The roadmap shows discipline. NOW should not try to launch every revenue line at once. Different engines activate as product-market fit, supply density, transaction volume and trust improve.

14. Illustrative economics and KPI framework

The model needs a simple economic illustration. The purpose is not to claim a forecast, but to show the logic of scale and the variables that the MVP will validate.

Illustrative driver	Scenario A	Scenario B	Scenario C
Monthly active users	100k	1.0m	10m
Intent sessions / user / month	4	5	6
Commercial conversion	3%	4%	5%
Avg. transaction / booking value	€35	€45	€55
Illustrative blended take rate	6%	7%	8%
Paid business accounts	500	7,500	80,000
Illustrative monthly SaaS ARPU	€49	€69	€79
Monthly transaction / performance revenue	€25.2k	€630k	€13.2m
Monthly SaaS revenue	€24.5k	€517.5k	€6.32m
Illustrative annual core revenue	€596k	€13.8m	€234m

Core proof metrics

- Intent-to-action rate
- Time-to-value
- Revenue per qualified intent
- Cross-category usage
- API / partner usage
- Commercial conversion rate
- Merchant incremental demand
- Revenue per active merchant
- Local discovery rate
- Supply match rate
- Merchant retention
- Repeat intent / usage frequency
- Healthy/local intent conversion

Important modelling note

All figures above are illustrative scenarios, not forecasts. The objective is to show economic logic, identify the most sensitive drivers and clarify what the MVP needs to validate.

15. Investor narrative and team alignment

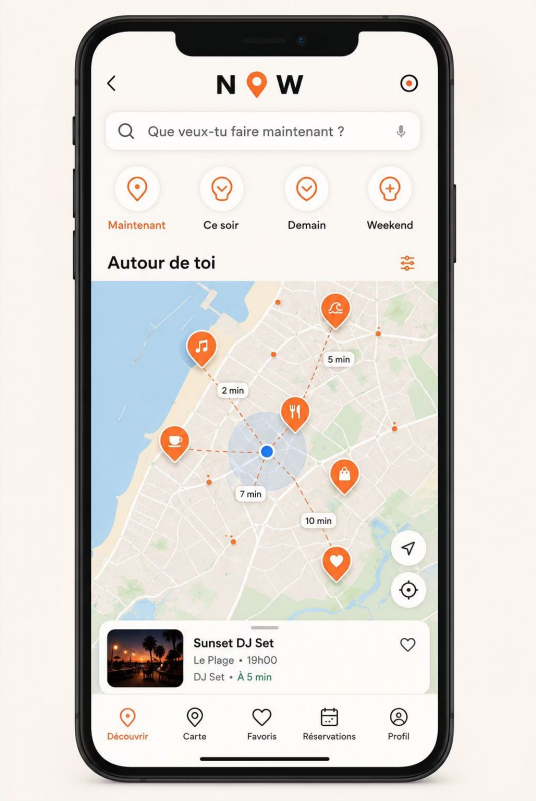

Recommended one-minute narrative

NOW is a real-time intent platform for the physical world. A user tells NOW what they want to do, where they are and when. NOW matches that intent with what is genuinely available around them. We monetise when that connection creates measurable value — through transactions, business software, performance fees, sponsored intent and, at scale, API, payment and data products. Beyond revenue, NOW can help people rediscover local life: healthier food, producers, activities, culture and services — while creating measurable demand for local businesses.

What not to say	What to say instead
“We have 27 ways to make money.”	“We have six monetisation engines and a staged path to activate them.”
“We fill empty restaurant tables.”	“Restaurants can be an early proof point, but the platform is category-neutral.”
“We will monetise data.”	“At scale, API, payment and selected data products add upside once trust and volume exist.”
“We can charge everyone.”	“We monetise where measurable value is created for the right payer.”
“It is an ecological app.”	“It can support local discovery, healthier choices and local economic activation.”

16. Product experience: from intent to action

How NOW turns a human question into a useful real-world outcome.

Product direction: one interface combining intent, time horizon, map context and actionable nearby options.

Step	What happens	Technical capability	Economic relevance
1. Ask	The user expresses what they want to do, naturally.	Natural-language intent capture, optional voice, location/time context	Creates a high-intent demand signal
2. Understand	NOW interprets category, timing, preferences, constraints and context.	Intent classification, context layer, user preference model	Improves match quality and commercial relevance
3. Match	NOW searches real-world supply around the user.	Supply graph, availability ingestion, partner feeds, local merchant data	Creates the bridge between demand and local supply
4. Verify	NOW prioritises what is genuinely possible now / tonight / tomorrow.	Real-time availability, opening hours, inventory, booking windows, confidence scoring	Reduces dead-end recommendations and builds trust
5. Recommend	NOW ranks the most relevant options, including transparent sponsored options where appropriate.	Ranking, personalisation, trust/safety rules, sponsored-intent guardrails	Supports sponsored intent without breaking relevance

Step	What happens	Technical capability	Economic relevance
6. Act	The user books, buys, calls, routes, saves or hands off to a partner.	Deep links, booking APIs, checkout, deposits, payment orchestration	Creates CPA, commission, transaction and payment revenue
7. Learn	NOW measures the outcome and improves future answers.	Attribution, analytics, merchant feedback, user signals	Enables performance pricing, merchant ROI and retention

Product principle

The user should not need to understand which marketplace, booking system, ticketing provider or merchant database sits underneath. NOW owns the intent layer and orchestrates the best available path to action.

17. Local impact measurement framework

Turn the local-impact story into measurable proof rather than a vague promise.

Local Impact should be treated as a product and operating thesis with measurable indicators. NOW can potentially create environmental and social co-benefits, but the company should measure them before making strong sustainability claims.

Sustainability wording

Prefer: “NOW can support local discovery, shorter-distance choices, local economic activation and better use of existing capacity.” Avoid claiming quantified carbon or health outcomes until they are measured.

Impact objective	Possible KPI	What it would show
Make local supply visible	% of successful intent sessions resolved within 1 km / 5 km / 15 km	How often NOW helps users find nearby options instead of distant alternatives
Support independent local businesses	Share of NOW-generated actions going to independent/local merchants	Whether demand is circulating through the local economy
Support producers and healthy food	Local-producer discovery rate; healthy/local intent-to-action conversion	Whether users can actually find and act on healthier and local choices
Activate unused capacity	Bookings or sales generated in previously low-demand windows	Whether NOW creates value from capacity that would otherwise go unused
Encourage active / local experiences	Share of activity, culture, outdoor and wellness intents that convert	Whether the product supports richer local everyday life
Reduce unnecessary search friction	Time-to-value and number of apps / handoffs avoided	Whether NOW simplifies local discovery
Territorial activation	Demand distributed beyond the most saturated zones	Potential value for cities, tourism bodies and business districts

18. Go-to-market and city launch logic

The MVP should prove density, usefulness and repeat behaviour - not merely accumulate listings.

- Launch in a geographically concentrated area where users can receive genuinely useful answers across several categories.
- Build supply density through a mix of direct local partners, open/partner inventory and affiliate relationships rather than waiting for complete direct coverage.
- Use restaurants as one visible proof point, but deliberately include activities, events, wellness, culture, local services and local food / producers to validate the universal thesis.
- Prioritise repeatable user moments: now, tonight, tomorrow and the weekend.
- Instrument the MVP from day one so that every launch city can be evaluated on supply match, action rate, repeat usage and merchant value.
- Keep city choice flexible. The right MVP market is the one that maximises team access, partner readiness, local density, test speed and user acquisition efficiency.

Launch layer	Goal	Example execution
Demand	Create repeated intent sessions	Local ambassadors, community partnerships, events, hospitality distribution, targeted acquisition
Supply	Reach useful category density fast	Direct merchants + affiliates + ticket/activity partners + local institutions
Trust	Make answers feel current and reliable	Availability confidence, transparent sponsored results, quality controls
Merchant proof	Show measurable incremental demand	Pilot cohort with conversion attribution and ROI dashboard
Local impact proof	Show that NOW surfaces what people did not know existed nearby	Producer / market / healthy food / culture / activity discovery pilots

19. Team, operating footprint and funding roadmap

Current team structure and internal funding plan supplied for NOW.

Role	Team member	Operating base / contribution
Founder & CEO	Benjamin Touchet	France - general management, vision, investors, founder narrative, local-market insight, fundraising and partnerships
CTO / Lead technology	Alessandro Heringer Milagres	São Paulo - technical architecture and product development
COO	Léo Lecaros	London - operations, monetisation structuring and international execution
Head of Development	Dylan	leads the development team and hands-on delivery of the MVP

International operating logic

The team is intentionally distributed across France, San Francisco, São Paulo and London. That creates access to multiple ecosystems, but the operating model must remain simple: one product thesis, one MVP roadmap, clear ownership and fast weekly decision-making.

Funding stage	Internal working target	Purpose
Day Zero / MVP	$250k	Build and validate the MVP, prove real-time intent matching, supply density and first commercial signals
Post-proof round	$750k-$1.2m	Accelerate product, integrations, merchant tooling, launch-market growth and commercial validation
Scale round	$3m-$5m	Expand cities/markets, deepen transaction infrastructure, API partnerships and operating capacity

Funding discipline

These amounts are working targets, not guaranteed financing. Investor communication should tie each round to specific proof milestones rather than only to time.

20. Strategic guardrails and investor questions

The strongest document anticipates the questions investors will ask.

Investor discipline

The document should be ambitious about the size of the platform, but precise about what is already built, what is an MVP hypothesis and what only becomes possible at scale. That distinction increases credibility.

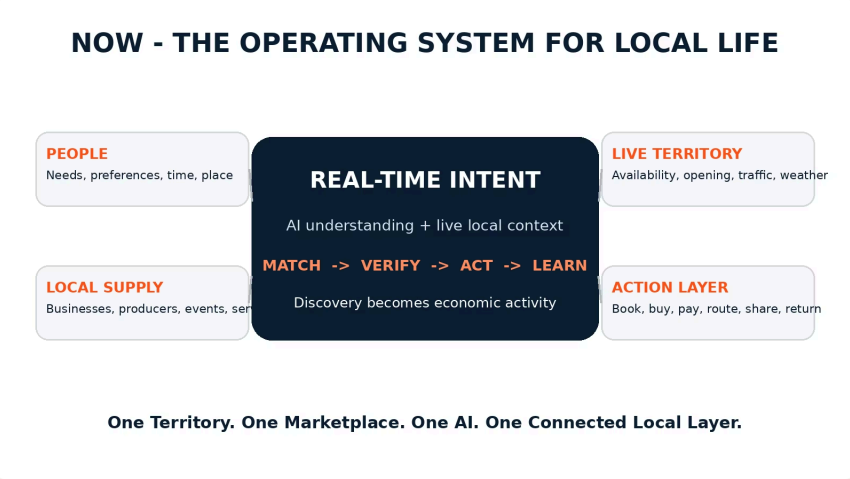

Likely question	Strong answer direction
Is this just another local discovery app?	No. The differentiation thesis is real-time intent + actual availability + action/transaction, rather than static discovery alone. The MVP must prove this.
Why would users change behaviour?	Because one contextual question can replace fragmented searching across multiple apps when the answer is useful, current and actionable.
Why will merchants pay?	Because NOW should attribute measurable demand, bookings and revenue, while also providing recurring operating tools through NOW for Business.
How do you solve the marketplace chicken-and-egg problem?	Partner inventory, affiliate/CPA coverage and direct local pilots allow useful supply before full merchant penetration.
Why is the model defensible?	Potential defensibility comes from the real-time intent/availability graph, integrations, transaction data, merchant workflows, repeat behaviour and partner distribution - not from the interface alone.
What is Local Impact commercially?	A demand-distribution advantage, a partnership narrative for cities/institutions, and a measurable reason for local businesses/producers to participate.
What should NOT be overclaimed?	Health outcomes, environmental impact, proprietary data advantage and financial-services economics should be described as future measurable opportunities until proven.

21. Exact additions to the original 27-model file

Page / section to add	Purpose
NOW is bigger than one vertical	State clearly that restaurants are examples, not the boundary of the platform.
Six monetisation engines	Group the 27 options under a strategy-level framework.
Universal transaction engine	Explain NOW as a multi-category transaction infrastructure.
Affiliate / CPA launch layer	Show how NOW monetises before owning all merchant relationships.
NOW for Business	Define the merchant product and monthly subscription logic.
Sponsored Intent	Explain the high-intent advertising model and guardrails.
NOW Engine / API	Expand licensing into a real enterprise / infrastructure pillar.
Local Impact / Better Living	Explain localism, producers, healthy discovery and territorial value.
Launch / Next / Scale	Show what activates now, later and at scale.
Illustrative economics	Show revenue logic using scenarios and core drivers.
Metrics	Define what the MVP will measure to validate commercial value.
Appendix: 27-model catalogue	Keep the original detail as optionality and strategic headroom.

22. Vision lock: the Operating System for Local Life

The final strategic hierarchy should be unmistakable: NOW is not only a discovery app and not only a marketplace. It is designed as an AI-powered operating layer for local life.

The hierarchy investors should remember

Level	What it means
1. Category vision	The AI-powered Operating System for Local Life.
2. Entry point	A natural-language question expressing real-time intent.
3. Intelligence layer	AI reads location, time, preferences, live supply and local context.
4. Action layer	Discovery can become booking, purchase, payment, navigation, sharing or return.
5. Economic layer	NOW monetises measurable value created across transactions, merchants, partners and infrastructure.

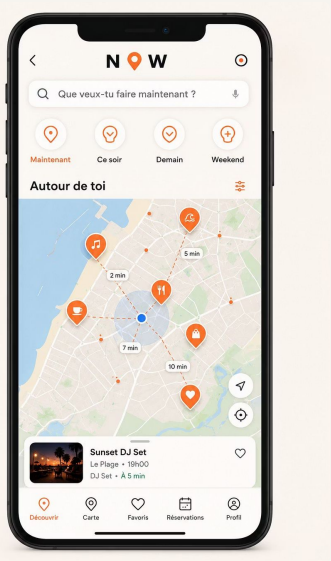

Core investor line

"NOW is the AI-powered Operating System for Local Life. Real-time intent is the entry point. The territory is the platform."

23. Live Territory and the complete customer journey

NOW should represent the territory as a living system rather than a static directory. Availability, opening hours, events, mobility, weather, demand, local inventory and user context continuously change. The product advantage is to make that changing reality actionable in one interface.

THE LIVE TERRITORY LAYER

Signal	Examples	Role in NOW
People	Intent, preferences, budget, time horizon	Defines what matters now
Places & supply	Businesses, producers, events, services	Defines what exists nearby
Live availability	Opening, capacity, inventory, booking windows	Defines what is actually possible
Context	Weather, traffic, seasonality, community activity	Improves relevance
Actions	Book, buy, pay, route, call, save, share	Turns discovery into outcome

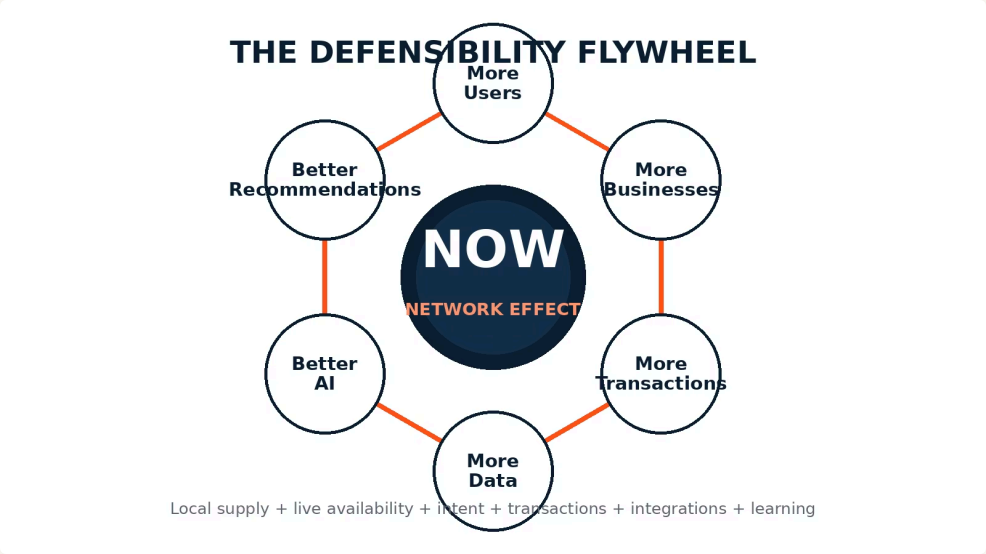

COMPLETE CUSTOMER JOURNEY

Discover -> Reserve -> Pay -> Navigate -> Experience -> Share / Review -> Return

The user should not need to know which marketplace, booking platform or merchant system sits underneath. NOW owns the intent layer and orchestrates the best path from question to action.

24. Network effects, defensibility and the NOW flywheel

The interface can be copied. The ecosystem is harder to copy. Long-term defensibility should come from the compounding interaction between local supply, live availability, user intent, transactions, merchant workflows, integrations, attribution and AI learning.

Investor takeaway

More users create more demand signals. More businesses create more live supply. More transactions create more outcome data. More data improves the AI. Better recommendations create more usage. The product and the network improve together.

Defensibility layer	Why it compounds	
	Real-time intent graph	Repeated questions reveal what people want, where and when.
Live supply / availability	Merchant and partner integrations make answers more current and useful.	
Transaction & attribution data	NOW learns which recommendations actually lead to action.	
Merchant workflows	NOW for Business creates operational dependence and recurring value.	
Partner distribution / API	Third parties can embed the same intelligence, widening reach.	
Local density	More useful supply in one territory improves user habit and merchant ROI.	

25. Future verticals and strategic coherence

The core architecture must remain category-neutral. The initial product can focus on the most actionable local categories, while the same intent-and-availability engine can later expand into additional parts of everyday local life.

Now / early proof	Expansion headroom
Restaurants & food	Healthcare discovery and appointments
Events & culture	Real estate and local property services
Activities & sport	Home, habitat and construction services
Wellness & beauty	Communities and civic services
Mobility & local services	Professional services
Hospitality & travel	Education, classes and local learning
Retail, producers & markets	Additional local verticals where real-time intent and action matter

Launch coherence

Hossegor / Seignosse can serve as a living laboratory and proof territory. The commercial MVP launch market can still remain flexible and should be selected on density, partner readiness, team access, test speed and acquisition efficiency. This keeps the original local vision while preserving execution discipline.

Funding coherence

The funding roadmap should be read as a sequence of proof stages. Day Zero / MVP financing validates the product and first commercial signals; later rounds fund acceleration and scale. Any larger Seed figure used in long-term vision materials should be labelled as a later capital stage rather than merged with the MVP working plan. No existing financial figure needs to change.

Final vision lock

NOW connects human intent to the living territory around it. The business model captures value when that connection becomes action. Local Impact makes the same system useful to communities, independent businesses and producers. Network effects make the system stronger as it grows. That is the complete strategic architecture.

Appendix A. Full 27-model catalogue

Kept to preserve the team's original depth, but reframed as optionality under the master strategy.

# / Model	How the money arrives	Strategic note
1. Flat subscription	One monthly fee per establishment, independent of volume.	Predictable recurring revenue; proven in practice in tools like Doctolib.
2. Tiered by size	Price by seats, covers or number of services.	Larger venues contribute more; common in restaurant software.
3. Annual licence, seasonally weighted	Twelve-month commitment billed evenly or weighted to high season.	Fits seasonal hospitality and tourism software.
4. Freemium with paid upgrade	Free forecasting / alerts; paid automation, publishing or reporting.	Standard route into SMB software.
5. Group and multi-site licence	Single contract for several venues, priced per location with volume rate.	Natural model for groups and chains.
6. Pay per campaign	Merchant pays each time an offer or campaign is built and pushed.	Useful for occasional users.
7. Prepaid credit packs	Merchant prepays a block of campaigns or covers.	Common in advertising and messaging platforms.
8. Vouchers for quiet services	Prepaid vouchers for low-occupancy services.	Gift-card style economics across hospitality.
9. Percentage take rate	A share of the bill on covers or transactions generated.	Default expectation in many marketplaces.
10. Flat fee per cover	Fixed amount per seated diner or equivalent action.	Avoids penalising large tables disproportionately.
11. Hybrid: small fee plus take rate	Monthly floor plus upside share.	Common convergence model in delivery and marketplace businesses.
12. Cost per new diner / customer	One-off fee only for first-time customer acquisition.	Merchant keeps the relationship after the first visit.
13. Incremental covers only	Charge only for demand shown to be additional.	Strong alignment, but requires forecasting confidence.
14. Yield share	Share of revenue recovered from unsold capacity.	Long-standing logic in travel / hospitality revenue management.

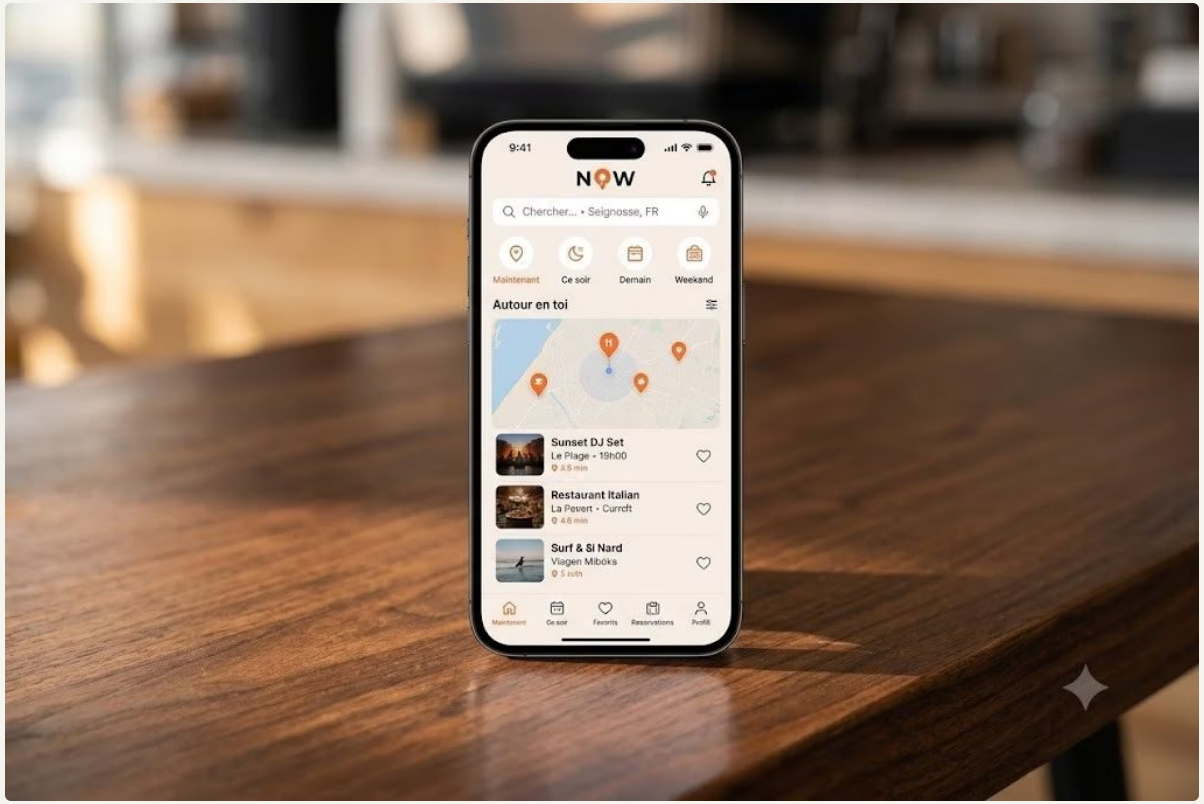

# / Model	How the money arrives	Strategic note
15. Share of spend uplift	Take a cut of basket or ticket increase.	Used when the platform shapes what is offered, not only who comes.
16. Paid visibility on empty slots	Merchants pay to surface quiet services or time windows.	Established second revenue line on marketplaces.
17. Outcome-guaranteed pricing	Fee reduced or waived if agreed occupancy target is not met.	Aggressive performance-based opening offer.
18. Wholesale of quiet capacity	Platform buys unused inventory at discount and resells it.	Hotel bed-bank and flash-sale logic.
19. Deposits and no-show cover	Platform manages deposits or no-show protection and keeps a share.	Increasingly standard in restaurant booking.
20. Revenue guarantee	Platform underwrites a floor in exchange for a larger share above it.	Premium revenue-management logic.
21. Consumer premium tier	Users pay for early access or membership benefits.	Useful when the merchant side should stay frictionless.
22. Institutional sponsorship	Tourism boards or districts fund demand activation.	Relevant for public bodies with seasonal or local-growth mandates.
23. Brand and supplier co-funding	Brands fund visibility or subsidise offers.	Classic trade-marketing mechanism.
24. Licensing the engine	Sell the forecasting / offer engine under partner branding.	Becomes broader NOW Engine / API in the new framing.
25. Data and benchmarking	Sell anonymised market intelligence or occupancy benchmarks.	Secondary product once scale exists.
26. Payment economics	Earn on booking/payment processing as well as lead generation.	Natural layer once checkout flows through the platform.
27. Advances on forecast revenue	Advance cash against visible future bookings or revenue.	Financial-services layer once NOW can predict merchant flows.

How to use this appendix

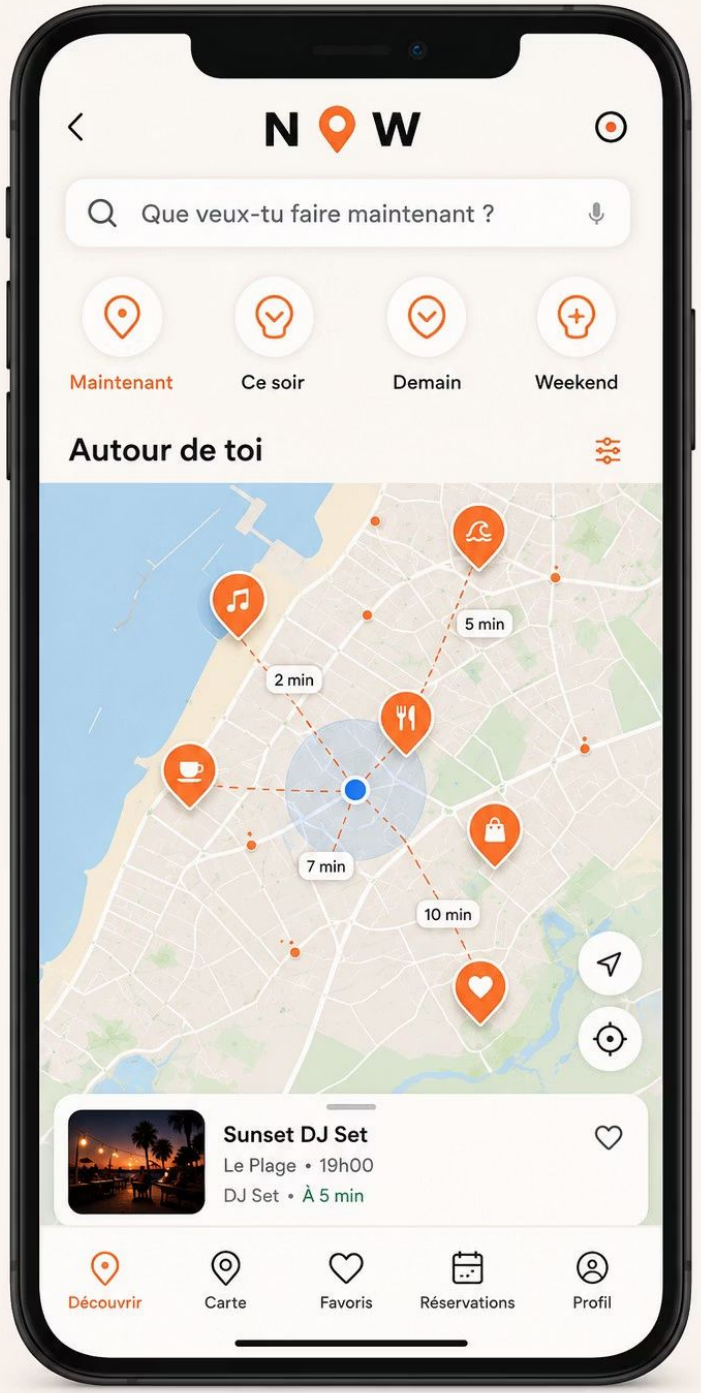

The 27 models are not alternatives so much as ingredients. They show optionality and strategic headroom. The master strategy should lead with the six engines, then draw selectively from this catalogue based on product maturity and market conditions.

Appendix B. Visual direction

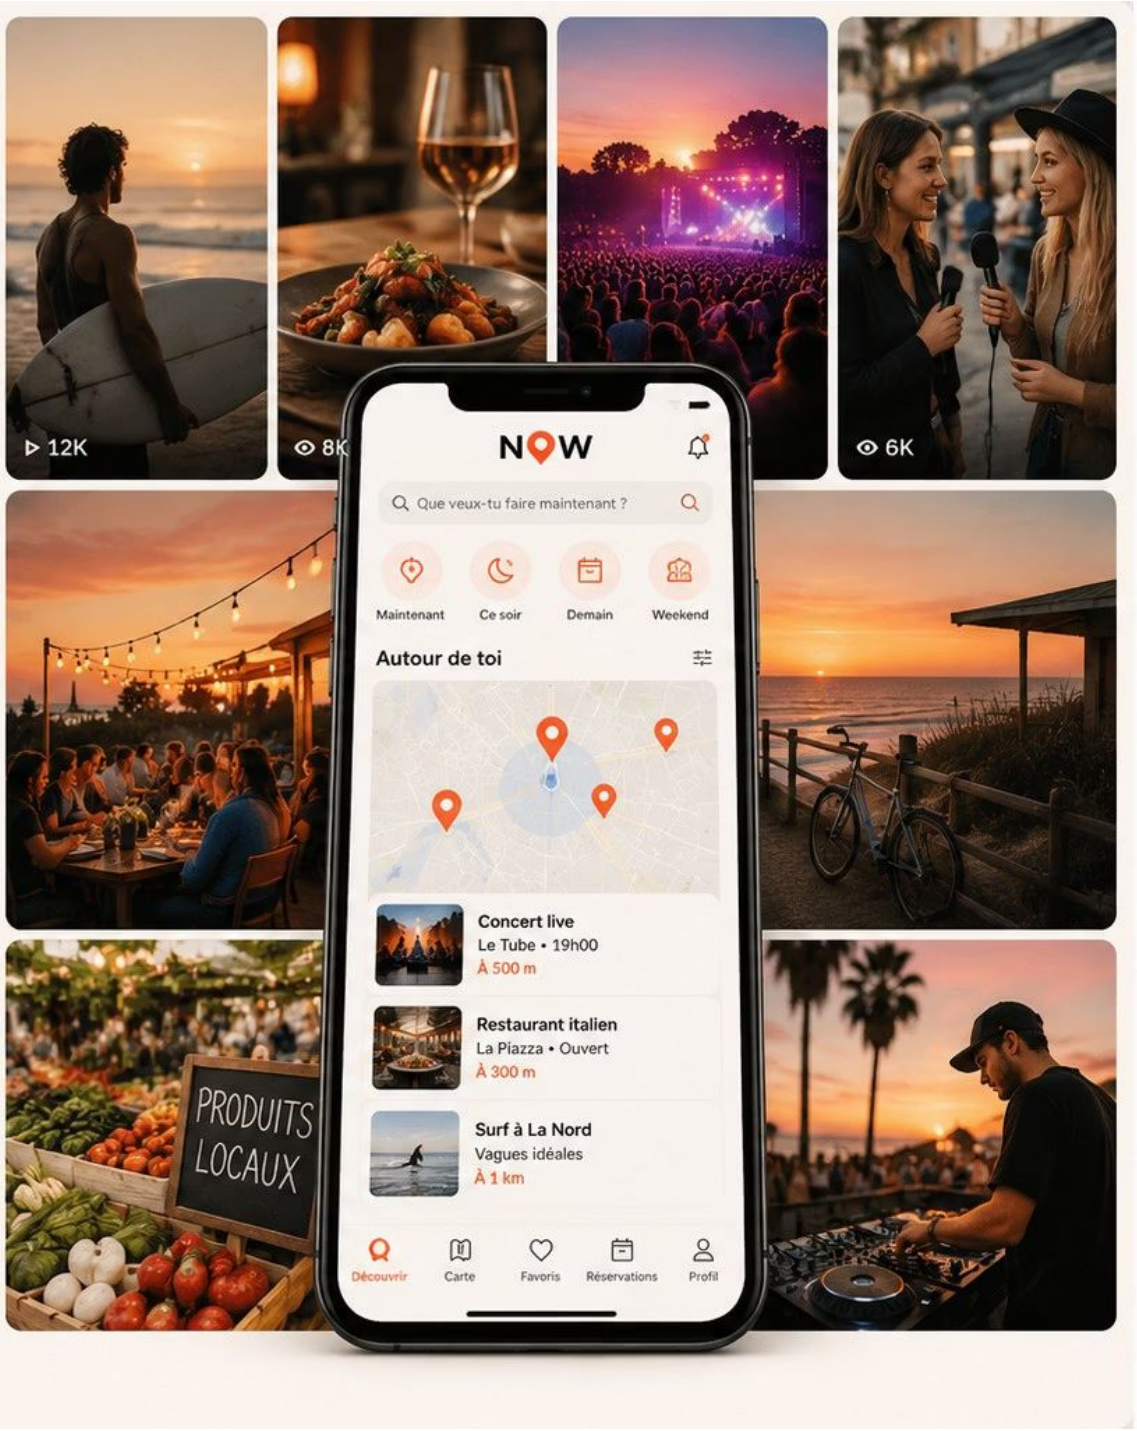

These images are included to give the final document a stronger presentation quality and to anchor the strategy in a clear product and brand direction.

Product-in-context visual: NOW as a premium local discovery experience.

Interface close-up: real-time search, timeline choices and local discovery map.

Lifestyle / category collage: surf, food, events, culture, local products and sunset experiences.

Final recommendation

Present this document as the master strategy memo. Keep the logo and visual direction consistent. Use the core thesis repeatedly: NOW monetises real-time intent in the physical world, and can create both scalable revenue and meaningful local impact.
